## What is CentroStella

It's a digital platform that integrates, elaborates and coordinates all the data from the different devices that it makes use of, analyzing the trends.

According to the data collected, alarms are generated in case of abnormal parameters registered. It also allows to historicize all the events, and create its own master data.

It was conceived with the specific goal to improve the quality of assistance, implementing it on an observational level, favoring the centrality of the guest and reducing the possibility of mistakes in the process of managing the patient.

Healthcare workers can, with given credentials, verify filter and extract all the data of interest.

With given credentials, the doctor can insert, verify or modify the therapy of the assisted and monitor vital parameters.

CentroStella allows to: monitor the assisted, both in Residential Facilities and at Home; manage therapy both in Residential Facilities and at Home; manage the assistance calls more promptly, reducing the risk of errors, becoming an instrument useful for risk management (risk management 4.0).
